Business Problem Statement

Objective

The objective of this project is to analyze supply chain operations to identify inefficiencies in inventory management, delivery performance, and logistics cost. The goal is to improve operational efficiency and support better decision-making.

Problem Description

Organizations often face challenges such as delayed deliveries, high transportation costs, inefficient warehouse utilization, and frequent backorders. These issues impact customer satisfaction and overall profitability.

Key Business Questions

- Which regions contribute the highest sales and inventory movement?
- Which suppliers incur the highest transportation costs?
- How efficient is the delivery process across different regions?
- What is the impact of backorders on overall operations?
- Are warehouses being utilized efficiently?

Expected Outcome

The analysis aims to provide actionable insights that help optimize supply chain performance, reduce delays, control costs, and improve inventory management.

Tools Used

- Python (Data preprocessing and feature engineering)
- MySQL (Data analysis and querying)
- Power BI (Data visualization and dashboarding)
